## YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

## END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <https://support.juniper.net/support/eula/>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

# Application Mappings

## IN THIS SECTION

- [What is an Application ID? | 2](#)
- [What Tasks Are Required to Map Applications? | 2](#)

JSA includes default application IDs. However, you can edit the application mapping file to ensure that traffic is appropriately classified in JSA.

## What is an Application ID?

When JSA detects a flow, it assigns an application ID to the flow. The application ID is assigned based on the protocol and ports that are used for the flow, and the flow content. JSA default application IDs are allocated based on the [Service Name and Transport Protocol Port Number Registry](http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.txt) (<http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.txt>).

## What Tasks Are Required to Map Applications?

When you create or customize an application mapping, do the following tasks in sequence:

### 1. "Defining New Applications" on page 3

The application configuration file contains default applications. To define new applications, you must add new applications IDs to the application configuration file.

### 2. Map traffic to the new applications by using one of the following methods:

- ["Define application mappings" on page 5](#)

Update the application mapping file, which maps applications to application IDs based on IP address and port number.

- ["Define application signatures" on page 9](#)

Define application signatures to apply to flows that the default application mapping does not automatically detect. To assign application IDs to flows, this method requires you to create rules that are based on IP address, port, and content. To define port-only application signatures, configure port mappings in the application mapping file, not the application signatures file.

# Defining New Applications

## IN THIS SECTION

- [Defining Application Mappings | 5](#)
- [Defining Application Signatures | 9](#)

JSA shows the name of the flow application on the **Network Activity** and **Offenses** tabs. You can define new applications or change the name that is shown for existing applications.

When you specify an application, the <appid> number must be unique. For custom applications, assign numbers that are in the 15,000 - 20,000 range. Within each application, you can define up to five levels of categorization, but JSA displays only the first three categories.

You can use the new flow applications API to manage the mapping of application IDs to application name.

Always configure the applications in the staged configuration area, which can be accessed by using the following API endpoint:

- `staged_config/flow/applications/active_applications`

After you update the application configuration in the staged configuration area, you must deploy the changes to propagate the updates to the system. After the changes are deployed, you can use the following endpoints to access the flow applications in the deployed configuration:

- config/flow/applications/active\_applications

The active configuration shows the list of applications that are currently in use.

- config/flow/applications/default\_applications

The default application list is read-only. Default applications are provided as a system backup in case the configuration for an active flow application is deleted or changed.

To manage the flow application mappings in earlier versions of JSA, you must manually edit the **apps.conf** file. When you define new applications in the **apps.conf** file, use the following syntax:

```
<appname><appid>
```

For each application, you can define up to five levels of categorization, and each subcategory is separated by a number sign (#). If an application contains fewer than five categories, include a number sign in place of each missing subcategory.

For example, to add `Authentication#Radius-1646####51343` as an application ID, insert the application ID as follows:

```
Authentication#Radius-1645####51342
Authentication#Radius-1646####51343 <- inserted application
Authentication#Radius-1812####51344
Authentication#Radius-1813####51345
```

1. To change the application mappings in JSA 7.4.3, use the RESTful API.

- a. Access the interactive API documentation interface by entering the following URL in your web browser:

```
https://ConsoleIPaddress/api_doc/
```

- b. Select **API version 16**, and go to the staged configuration endpoint:

```
/api/staged_config/flow/applications/active_applications
```

- c. Complete the request parameters.

For example, you might POST the following parameters:

```
{  
  "id": 15001,  
  "level_one": "String",  
  "level_two": "String",  
  "level_three": "String",  
  "level_four": "String",  
  "level_five": "String",  
}
```

- d. Click **Try it out** to send the API request to your console and receive a properly formatted HTTPS response.

**NOTE:** When you click **Try it out**, the action runs in the staging area on the JSA system. Active applications that are in the staged configuration area are not yet deployed.

2. To change application mappings in JSA 7.4.2 and earlier, edit the **apps.conf** file.

- a. Using SSH, log in to JSA as the root user.
- b. Edit the following file:

**/store/configservices/staging/globalconfig/apps.conf**

- c. Insert the new applications, in alphabetical order.
- d. Save and exit the file.

3. Log in to JSA as an administrator.

4. Click the **Admin** tab.

5. On the toolbar, click **Deploy Changes**.

Update the application mapping and applications signature files.

## Defining Application Mappings

To identify application signatures, create user-defined application mappings that are based on the IP address and port number.

You must add the new application IDs. For more information, see "Defining New Applications" on page 3.

When you update the application mapping file, follow these guidelines:

- Each line in the file indicates a mapped application. You can specify multiple mappings, each on a separate line, for the same application.
- You can specify a wildcard character (\*) for any field. Use the wildcard character alone, and not as part of a comma-separated list. The wildcard character indicates that the field applies to all flows.
- You can associate a flow with multiple mappings. A flow is mapped to an application ID based on the mapping order in the file. The first mapping that applies in the file is assigned to the flow.
- When you add new application ID numbers, you must create a new and unique application ID number. The application ID number must not exist in the **apps.conf** file. Apply numbers that range 15,000 - 20,000 for custom applications.
- The format of the entry must resemble the following syntax:

```
<New_ID> <Old_ID> <Source_IP_Address>:<Source_Port> <Dest IP Address>:  
<Dest_Port> <Name>
```

*<New\_ID>* specifies the application ID you want to assign to the flow. A value of 1 indicates an unknown application. If the ID you want to assign does not exist, you must create the ID in the **apps.conf** file. For more information, see "Defining New Applications" on page 3.

*<Old\_ID>* specifies the default application ID of the flow, as assigned by JSA. A value of \* indicates a wildcard character. If multiple application IDs are assigned, the application IDs are separated by commas.

*<Old\_ID>* specifies the default application ID of the flow, as assigned by JSA. A value of \* indicates a wildcard character. A value of 0 or 1 indicates an application that has not been identified by another algorithm. If multiple application IDs are assigned, the application IDs are separated by commas.

- If using wildcard characters for *<Old\_ID>* is inapplicable or the application is currently being classified, determine the application ID in the following these steps:
  1. Log in to the JSA interface.
  2. Click the **Network Activity** tab.
  3. Pause the live stream and filter to find the flow that is misclassified.
  4. Double-click the affected flow.

5. Hover over the value for the Application field to see **ID** and **Desc**. This ID can then be used in application mapping rules.

**Table 1: Application IDs**

| Option                         | Description   | Values   |
|--------------------------------|---|--|
| <i>Source_IP_Address</i>       | Specifies the source IP address of the flow.              | Can contain either a comma-separated list of addresses or CIDR values. A value of * indicates a wildcard character, which means that this field applies to all flows.  |
| <i>&lt;Source_Port&gt;</i>     | Specifies the associated port.                            | Can contain a comma-separated list of values or ranges that are specified in the format: <i>&lt;lower_port_number&gt;-&lt;upper_port_number&gt;</i> . A value of * indicates a wildcard character, which means that this field applies to all flows. |
| <i>&lt;Dest_IP_Address&gt;</i> | Specifies the destination IP address of the flow.         | Can contain either a comma-separated list of addresses or CIDR values. A value of * indicates a wildcard character, which means that this field applies to all flows.  |
| <i>&lt;Dest_Port&gt;</i>       | Specifies the associated destination port.                | Can contain a comma-separated list of values or ranges that are specified in the format: <i>&lt;lower_port_number&gt;-&lt;upper_port_number&gt;</i> . A value of * indicates a wildcard character, which means that this field applies to all flows. |
| <i>&lt;Name&gt;</i>            | Specifies a name that you want to assign to this mapping. | Optional   |

The following example of mapping file **/user\_application\_mapping.conf** maps all flows that match the IP addresses and ports for which the JSA flow processor assigned to the old ID of 1010. It assigns the new

ID of 15000 when it originates from either of two subnets in 10.100.\*, and when designated for a specific address and either of two destination ports:

```
15000 1010 10.100.100/24,10.100.50.10:* 172.14.33.33:80,443
```

The following example overrides the assigned name for application ID 1010. It specifies a new application, ID 15100, based on any traffic that is going to port 33333 or a range of destination ports for specific addresses or application overrides.

**NOTE:** Due to PDF formatting, do not copy and paste the message formats directly into the interface. Instead, paste into a text editor, remove any carriage return or line feed characters, and then copy and paste into the interface.

```
15000 1010 10.100.100/24,10.100.50.10:* 172.14.33.33:80,443 AllowedWebTypeA
15000 1010 10.100.30/24:* 172.14.33.20:80 AllowedWebTypeA
15100 * *:33333
10.35.20/24,10.33/16,10.77.34.12:33333,33350-33400 GameX
15100 1,34803,34809 *:33333 *:33333,33350-33400 GameX
```

The following example shows the assignment of new application names and IDs, based on matching three application IDs, one of which is the application identifier (1). These application IDs match on a basic hit of a specified destination port, for any traffic:

```
21200 1,34803,34809 *:* *:123 ntp
34731 1,34803,34809 *:* *:1241 Nessus
2001 1,34803,34809 *:* *:1214 Kazaa
```

1. Use SSH to log in to JSA as the root user.
2. Access the **Network Activity** tab.
3. To determine the default application IDs, hover your mouse pointer over the application field for a flow that is associated with the application you want to update.
4. Choose one of the following options:
  - Open the following file:  
**/store/configservices/staging/globalconfig/user\_application\_mapping.conf**
  - If the **user\_application\_mapping.conf** does not exist in your system, create the file and place the empty file in the following directory: **/store/configservices/staging/globalconfig/**

5. Update the file, as necessary.
6. Save and exit the file.
7. Log in to the JSA user interface.
8. Click the **Admin** tab.
9. Click **Deploy Changes**.

## Defining Application Signatures

Use the application signatures file to create IP address and content-based rules that assign application IDs to flows that JSA does not automatically detect.

The application signatures file is a definition file that is distributed to all JSA Flow Processor by the primary JSA console. The file includes source and destination ports, and ranges.

The application signatures file includes the following characteristics:

- Hex content is delimited with the pipe character (|):

```
<dstcontent offset="0" depth="4">|45 54|</dstcontent>
```

```
<dstcontent offset="0" depth="4">GET</dstcontent>
```

- A flow can be associated with multiple signatures. A flow is mapped to an application ID based on the signature order in the file. The first signature that applies in the file is assigned to the flow.
- When you edit the **signatures.xml** file, the data that is inserted between the XML tags is case-sensitive. For example, when you specify TCP within the XML tags, enter the value with all capital letters.
- Modifying or removing existing signatures is not supported. Any changes made to the signatures will be restored on the next JSA Auto Update. If any signature is consistently classifying flows incorrectly, please contact [Juniper Customer Support](#).
- To make a signature unique and not to be overwritten by JSA Auto Update, the "appid" and "sigid" pair should be unique.

The following code is an example of a **Signatures.xml** file:

```

<signatures>
  <signature>
    <appid>1009</appid>
    <appname>IMAP</appname>
    <groupname>Mail</groupname>
    <colour>#ff0000</colour>
    <description>IMAP traffic</description>
    <revision>1</revision>
    <protocol>TCP</protocol>
    <srcip>any</srcip>
    <srcport>any</srcport>
    <dstip>any</dstip>
    <dstport>any</dstport>
    <commondstport>143</commondstport>
    <srccontent offset="0" depth="128" ignorecase="true">LOGIN</srccontent>
    <dstcontent offset="0" depth="5">* OK</dstcontent>
    <weight>30</weight>
  </signature>
</signatures>

```

1. Use SSH to log in to JSA as the root user.
2. To change to the globalconfig directory, type the following command:

`cd /store/configservices/staging/globalconfig`

3. Open the following file:

**signatures.xml**

4. Make the necessary changes using the following parameters:

**Table 2: Application Signatures Default Parameters**

| Parameter | Description   |
|-----------|---|
| appid     | A unique ID for each application that you want to define. Use numbers in the 15,000 - 20,000 range for custom applications. |

**Table 2: Application Signatures Default Parameters (*Continued*)**

| Parameter     | Description   |
|---------------|---|
| appname       | The name of the application. The application name is used in the <b>Network Activity</b> and <b>Offenses</b> tabs.                                    |
| groupname     | The group name for the application. Used only with the automatic generation script.   |
| description   | The long description of the application and any required notes for the particular signature.  |
| revision      | Use for version control.  |
| protocol      | If the same signature is required for more than one protocol, define the second signature.  |
| srcip         | The specific source IP address. Use multiple application identifications when more than one source IP address is required.                            |
| srcport       | The specific source port for the signature. Use multiple application identifications when more than one source port is required.                      |
| dstip         | The specific destination IP address. Use multiple application identifications when more destination IP addresses are required.                        |
| dstport       | The specific destination port for the signature to execute. Use multiple application identifications when more than one destination port is required. |
| commondstport | The destination port that is most commonly associated with the application.   |
| commonsrcport | The source port that is most commonly associated with the application.  |

**Table 2: Application Signatures Default Parameters (*Continued*)**

| Parameter                   | Description   |
|-----------------------------|---|
| scrcontent <offset> <depth> | <p>&lt;offset&gt; is the offset in the payload where you want to begin searching for the source content. If no value is specified, the default is 0.</p> <p>&lt;depth&gt; is the offset in the payload you want to stop the search.</p> <p>For example, if you configure the following value, the payload is searched 5-15 bytes:</p> <pre>scrcontent 5 10</pre>          |
| dstcontent <offset> <depth> | <p>&lt;offset&gt; is the offset in the payload where you want to begin searching for the destination content. If no value is specified, the default is 0.</p> <p>&lt;depth&gt; is the offset in the payload you want to stop the search.</p> <p>For example, if you configure the following the value, the payload is searched 5-15 bytes:</p> <pre>scrcontent 5 10</pre> |
| weight                      | The weight that you want to assign this application. The weight influences any potential rules and offenses created based on data using this application. Increasing the value of the weight increases the magnitude of the offense when it is created.   |

5. Save and exit the file.
6. Log in to JSA.
7. Click the **Admin** tab.
8. Click **Deploy Changes**.

# Default Applications

JSA includes default application IDs, which you can see in the applications configuration file (/store/configservices/staging/globalconfig/apps.conf). The default application values apply to all source and destination flows. However, the destination port is specific to the application.

The following tables describes the default Application values for JSA:

| Application group | Sub-components                | Value     | Description                                       |
|-------------------|-------------------------------|-----------|---|
| Authentication    | <b>LDAP</b>                   | 1019      | LDAP traffic                                      |
| Authentication    | <b>MSGAuthentication</b>      | 20998     | MSG authentication traffic                        |
| Authentication    | <b>NTLMSSP</b>                | 5700      | NT LAN Manager Support Provider (NTLMSSP) traffic |
| Authentication    | <b>Radius</b>                 | 51342     | Radius traffic                                    |
| Authentication    | <b>Radius</b>                 | 51344     | Radius traffic                                    |
| Authentication    | <b>Radius</b>                 | 51345     | Radius traffic                                    |
| Authentication    | <b>tacacs</b>                 | 21028     | Tacacs traffic                                    |
| Authentication    | <b>TACACS-DatabaseService</b> | 21061     | Tacacs Database Service traffic                   |

# ICMP Type and Code IDs

## IN THIS SECTION

- Identifying Default ICMP Types | [92](#)
- Identifying Default ICMP Codes | [93](#)

This reference provides information about default ICMP type and Code IDs.

## Identifying Default ICMP Types

The following table lists the default ICMP types:

| ICMP Type | Message                 |
|-----------|-------------------------|
| 0         | Echo reply              |
| 3         | Destination unreachable |
| 4         | Source quench           |
| 5         | Redirect                |
| 8         | Echo                    |
| 9         | Router advertisement    |
| 10        | Router selection        |
| 11        | Time exceeded           |

*(Continued)*

| ICMP Type | Message              |
|-----------|----------------------|
| 12        | Parameter problem    |
| 13        | Timestamp            |
| 14        | Timestamp reply      |
| 15        | Information request  |
| 16        | Information reply    |
| 17        | Address mask request |
| 18        | Address mask reply   |
| 30        | Traceroute           |

## Identifying Default ICMP Codes

The following tables list the default ICMP codes:

**Table 3: ICMP Type 3: Destination Unreachable Codes**

| Destination Unreachable Code | Description             |
|------------------------------|-------------------------|
| 0                            | Net is unreachable      |
| 1                            | Host is unreachable     |
| 2                            | Protocol is unreachable |

**Table 3: ICMP Type 3: Destination Unreachable Codes (*Continued*)**

| Destination Unreachable Code | Description   |
|------------------------------|---|
| 3                            | Port is unreachable   |
| 4                            | Fragmentation is needed and <b>Don't Fragment</b> was set             |
| 5                            | Source route failed   |
| 6                            | Destination network is unknown  |
| 7                            | Destination host is unknown   |
| 8                            | Source host is isolated   |
| 9                            | Communication with destination network is administratively prohibited |
| 10                           | Communication with destination host is administratively prohibited    |
| 11                           | Destination network is unreachable for type of service                |
| 12                           | Destination host is unreachable for type of service                   |
| 13                           | Communication is administratively prohibited                          |
| 14                           | Host precedence violation   |
| 15                           | Precedence cutoff is in effect  |

**Table 4: ICMP Type 5: Redirect Codes**

| Redirect Code | Description   |
|---------------|---|
| 0             | Redirect datagram for the network (or subnet)         |
| 1             | Redirect datagram for the host                        |
| 2             | Redirect datagram for the type of service and network |
| 3             | Redirect datagram for the type of service and host    |

**Table 5: ICMP Type 11: Time Exceeded Codes**

| Time Exceeded Code | Description                             |
|--------------------|---|
| 0                  | <b>Time to Live</b> exceeded in transit |
| 1                  | Fragment reassembly time exceeded       |

**Table 6: ICMP Type 12: Parameter Problem Codes**

| Parameter Problem Code | Description                 |
|------------------------|-----------------------------|
| 0                      | Pointer indicates the error |
| 1                      | Missing a required option   |
| 2                      | Bad length                  |

# Port IDs

This reference provides information about default port IDs used by JSA.

The application identifications are limited to the port-based mappings defined in the `/opt/qradar/conf/appid_map.conf` file.

The following table lists the default common ports:

| Port | Protocol | Protocol description        |
|------|----------|-----------------------------|
| 7    | Echo     |                             |
| 9    | Discard  |                             |
| 13   | Daytime  |                             |
| 15   | netstat  |                             |
| 17   | QOTD     | Quote of the Day            |
| 18   | MSP      | Message Send Protocol       |
| 20   | FTP      | File Transfer Protocol      |
| 21   | FTP      | File Transfer Protocol      |
| 22   | SSH      | Secure Shell                |
| 23   | Telnet   |                             |
| 24   | xfer     | XFER Utility                |
| 25   | SMTP     | Send Mail Transfer Protocol |

# Protocol IDs

This reference provides information about default protocols IDs used in JSA.

The following table lists the default common protocols:

| Protocol ID | Protocol port description |
|-------------|---------------------------|
| 6           | TCP                       |
| 17          | UDP                       |
| 1           | ICMP                      |
| 2           | IGMP                      |
| 38          | IDPR-CMTP                 |
| 40          | IPv6                      |

*(Continued)*

| Protocol ID | Protocol port description |
|-------------|---------------------------|
| 46          | RSVP                      |
| 47          | GRE                       |
| 50          | ESP                       |
| 51          | AH                        |
| 54          | NARP                      |
| 89          | OSPFIGP                   |
| 94          | IPIP                      |
| 99          | ANY                       |
| 132         | SCTP                      |
